6 The Laws of Relationship Management

7

8

9 **Version:** 1.0

10 **Date:** 25 February 2015

11 **Editor:** Ian Glazer and Joni Brennan

12 **Contributors:**

13 The full list of contributors can be referenced here:

14 <https://kantarainitiative.org/confluence/display/irm/Participant+roster>

15

16 **Status:** This document is a **Kantara Initiative Final Report**, created by the IRM WG
17 (see section 3.9 and 4 of the Kantara Initiative Operating Procedures)

18 **Abstract:**

19 This report discusses the Laws of Relationships and in the context of Identity
20 Relationship Management. The Laws of Relationships have been generated as a result
21 of industry discussions inspired by the Pillars of Identity Relationship Management.

22

86

87 **1 THE CHALLENGE JUST AHEAD**

88 The identity and access management industry and its professionals are used to dealing
 89 with reasonable numbers of people with reasonable numbers of attributes. A classic
 90 example is employees in an enterprise setting. The enterprise has at least one
 91 authoritative source for employee identity and those identities have a few dozen
 92 attributes. Using that information, IAM systems and professionals can then begin to grant
 93 access, segregate duties, and manage user lifecycles. We have experience in handling
 94 these types of scenarios as they grow and evolve. Currently, the identity industry is
 95 primarily optimized for these scenarios.

96 In the near future, however, the industries current optimizations will not be sufficient. Our
 97 world is becoming one dominated by an unreasonably large amount of “things.” From
 98 smartphones to connected-device laden homes to industrial sensors, the number of
 99 actors and the connections between them in the world of identity is growing at a
 100 geometric rate. Unfortunately, that growth has not been mirrored by innovation in the
 101 identity industry. The current policies, technologies and processes that govern identity
 102 management, cannot handle this changing landscape.

103 Finally, as things and human identities start to bind to each other, we end up with an
 104 unreasonably large number of relationships among an unreasonably large numbers of
 105 people and things, each with sets of attributes.

106 A world like the one depicted in the previous illustration is neither fantastic nor futuristic.
 107 It is the near future of our world. This Working Group posits that the identity industry's
 108 prior knowledge, techniques, and tools are necessary but not sufficient to solve for the
 109 problems that this near future poses. We believe that additional thought and approach is
 110

111 required; we offer *identity relationship management* as an additional approach to the
112 identity industry.

113

114 **1.1 Purpose and Audience**

115 The principles in this document specify the meaning and function of relationships as a
116 component of digital identity services. They outline what relationships need to represent
117 and how they need to behave to maintain the integrity, coherence and utility of identity
118 services at Internet scale. The initial goal of the document is to serve as a conversational
119 substrate to capture evolving concepts around Identity and Access Management (IAM).
120 The ideal goal for the document is to inform design principles for consideration and
121 adoption and in doing so leverage Kantara Initiative process and programs broadly
122 applicable to any innovative IAM approaches.

123 This document is presented as a report to the Kantara Initiative for consideration in its
124 discussion group, work group and program efforts.

125 The document is also intended as a public resource for:

126

- 127 A. “Traditional” identity professionals curious as to how IAM could work at Internet
128 scale, in an inter-federated world, while serving the needs of people, “things,”
129 groups, and organizations.
- 130 B. Designers, engineers and authors developing new systems, protocols and
131 standards.
- 132 C. IT and business professionals planning and operating services within
133 organizations and on the open market.

134

135 **1.2 Why Develop “Laws?”**

136 This report introduces design principles and questions meant to provoke thought and
137 research regarding the future of Identity and Access Management in the context of the
138 Pillars of Identity Relationship Management. In some sense referring to what follows as a
139 set of laws captures the aspirational notion of this Working Group; we are in search of
140 basic principles, characteristics, and natures of relationships - things that are true and
141 consistent. This Working Group has formed not as an indulgence to our philosophical
142 nature but to help the identity industry and its professionals to:

- 143 ● Validate project scope
- 144 ● Inform design
- 145 ● Test existing solutions
- 146 ● Identify gaps in existing architectures and deployment models
- 147 ● Establish design patterns for IRM solutions
- 148 ● Estimate complexity of implementing and/or migrating to an IRM solution
- 149 ● Propose migration roadmaps

150 2 THE LAWS OF RELATIONSHIPS

151 What follows is a point in time glimpse at Relationships and their characteristics. It is the
152 full intent of the Identity Relationship Management Working Group to continue to refine
153 and evolve the notion of Relationships and the associated characteristics. Although this
154 report and its contributors refer to the following list as “laws,” there is some hesitance to
155 do so. In some sense, the use of the word “laws” is meant as a reverent hearkening back
156 to Cameron’s Laws of Identity¹. These Laws are not presented on stone tablets, eternally
157 fixed, but on still wet clay tablets yet to be baked.

158 Although the following laws describe a relationship as a connection between an
159 individual actor and another individual actor (e.g. one person in a relationship with a
160 single thing), the Identity Relationship Management Working Group is and will continue
161 to be as inclusive as possible to all use cases. In this context, although the examples
162 describe relationships between individual actors, the laws must be able to describe and
163 inform scenarios involving groups of actors in relationships with other groups of actors.

164 Similarly, although the following laws tend to discuss person-to-person interactions and
165 relationships, these laws of relationships must be just as applicable to “things.”
166 Regardless of whether the Reader is considering a system of carbon- or silicon-based
167 life forms (or more likely a mixture of both), these laws need to be useful and relevant.
168 That being said, it is likely that some of these laws will have different implications
169 depending if the relationship in question is person-to-person, thing-to-thing, or person-to-
170 thing. The Working Group leaves the study of those nuances for later work.

171 Finally, this presentation of the laws is not meant as an evaluation tool for conformance
172 to the notion of Identity Relationship Management. The laws are a set of design choices,
173 not a prescriptive list of mandatory items. At this stage, it is more important for the
174 Reader (and the identity management industry) to consider, challenge, improve, and
175 hopefully adopt the laws of relationships than it is to prematurely define and enforce
176 conformance.

177 2.1 Scalable

178 **Relationships must be scalable.** More specifically, the model for relationships and
179 management of relationships must be scalable. Where identity and access management
180 has been comfortable dealing with millions of objects each with dozens of attributes, the
181 number of relationships traditional IAM has had to manage has been fairly low. First with
182 mobile computing and now the Internet of Things, the number of relationships IAM
183 systems and professionals will need to design for and manage will increase at a
184 geometric rate. A ten million object directory will look quaint in a world of billions of
185 “things” involved in trillions of relationships.

¹ <http://www.identityblog.com/stories/2005/05/13/TheLawsOfIdentity.pdf>

186 The notion of scalability in the world of Identity Relationship Management must cover
187 four things:

- 188 • Actors
- 189 • Attributes
- 190 • Relationships
- 191 • Administration

192 The first three (actors, attributes, and relationships) are what the identity industry has
193 grown to do well - accommodate more: more roles, more people, more systems.
194 However the geometric increase in the number of actors and associated relationships
195 will put a burden on existing administrative tools and techniques that the identity industry
196 heretofore has never had to deal with. A world of relationships will require new thinking
197 on the user experience, methods, and analogies presented to people to aid their attempt
198 to manage their increasing complex world.

199 2.2 Actionable

200 **Relationships must be actionable.** We want relationships that are able to do
201 something of value and, more specifically, relationships that can carry
202 authorization data. However, relationships are not required to carry authorization
203 data. The key is that they have the ability to do so.

204 In a traditional IAM scenario, we pass actionable information to the back-end for
205 a classic request-response authorization model. But in an IRM (and IoT) world
206 we must design for situations in which there is little to no connectivity to a back-
207 end authority or that a back-end authority simply does not exist.

208 2.3 Immutable

209 **Relationships can be immutable.** Immutable relationships do not change.
210 Immutable relationships may provide the ground layer for assurance in the grand
211 scheme of Identity Access Management. Immutable relationships provide
212 important contextual information. Immutable relationship examples might look
213 like:

- 214 • This thing was made by Apple.
- 215 • This thing was built by Tesla.

216 It is crucial to observe that only some relationships are immutable. Immutable
217 relationships are found in supply chain and industrial settings. However outside
218 of settings such as those, most relationships are not, cannot, and should not be
219 immutable. “The future is unwritten,” as Joe Strummer said, and IRM and these
220 Laws must not prevent the growth and transformation of relationships over time.

221 2.4 Contextual

222 **Relationships can be contextual.** More accurately stated, some relationships
223 can be “triggered” by changes in context. Changes to conditions external to the
224 relationship can have bearing on both how the actors in the relationship behave
225 as well as what an external party can observe about the relationship.

226 Consider this example scenario: Before traveling abroad, I contract with a mobile
227 network operator (MNO) to get a SIM card that will allow my phone to work at my
228 destination. Until the SIM card via my phone connects with and pings a cell tower
229 the relationship is inactive. The MNO doesn't bill me for my usage because
230 there's been none. Once my phone with the SIM in it activates the relationship
231 (by connecting to a cell tower at my destination) then the relationship between
232 me and MNO springs into action and I begin to be billed for my usage.

233 **2.5 Transferable**

234 **Relationships can be transferred.** A transferable relationship is one in which
235 one party in the relationships can be substituted for another. That substitution
236 can be done on a temporary basis or permanently.

237 **2.5.1 Temporary**

238 A relationship and certain related attributes are temporarily transferred from one
239 actor, entity, or device to another. These scenarios should be familiar for people
240 working with delegation use cases.

241 Example: I am a client of an organization. I might want to delegate my abilities to
242 some one else. I may seek a lawyer to draw up a Power of Attorney agreement
243 to delegate a specified authority from one actor to another. Alternatively I can
244 choose to remove or revoke that delegation and the transfer of authority for the
245 relationship goes away.

246 **2.5.2 Permanent**

247 A relationship and certain related attributes are permanently transferred from one
248 actor, entity, or device to another.

249 Example: I own a set of jet engines. I want to sell them to a client. I permanently
250 transfer the ownership to someone else. In the real world, I would hand over the
251 title. In the digital world, stakeholders may seek a strong cryptographically
252 protected flow to prove the relationship transference and context.

253 **2.6 Provable**

254 **Relationships must be provable.** In order to demonstrate to an external party
255 that a collection of things and people are connected, there needs to be some
256 mechanism to prove the existence of a relationship or set of relationships. The
257 ability to prove the existence and nature of relationships improves trust between
258 parties, provides auditability and traceability, and potentially reduces
259 asymmetries of power.

260 **2.6.1 Single-party Asserted**

261 A single-party relationship is asserted by a single-party. For example, I may claim
262 to work for Joni. In the single-party asserted scenario only one of the parties in
263 the relationship makes such a claim. In that sense, a single-party asserted
264 relationship feels a bit like a self-issued SSL certificate.

265 **2.6.2 Multi-party Asserted**

266 Multiple-parties assert that the relationship exists. For example, I claim that I
267 work for Joni and she claims that I work for her. In the multi-party asserted
268 scenarios all participants make associated claims that back each other's up. If I
269 claimed to work for Joni and she says that I don't, then in the eyes of an external
270 observer, I may or may not work for Joni. One could imagine a resolution process
271 much like PDP-chaining in XACML version 3.0.

272 **2.6.3 Third-party**

273 Third-parties assert that the relationship exists. For example, human resources
274 claims that I work for Joni. In this case, the external observer treats the statement
275 from human resources as authoritative. Human resources is acting, to some
276 extent, like an identity proofing service for the relationship - a relationship
277 proofing service.

278 Social networks can act as relationship proofing services and the same is true of
279 law enforcement databases that track known associates. An area worth exploring
280 is "what are the IoT equivalents?" Will home automation companies become the
281 "Facebook" of our things?

282 **2.7 Acknowledgeable**

283 **Relationships can be acknowledged.** Participants can acknowledge that they have
284 relationships to other actors. In this regard, the acknowledgeable characteristic of
285 relationships feels very similar to single-party asserted relationships. A question
286 worth asking is, "Must all parties in a relationship acknowledge they are in a
287 relationship?" In a situation where only one party knows of the existence of the
288 relationship, then there is an asymmetry of power. The party that knows about
289 the relationship can exert some form of control over the other party. For example,
290 credit bureaus acknowledge their relationship to me but do I acknowledge my
291 relationship with them? Similarly, I acknowledge that I have a relationship with
292 Twitter, but do I acknowledge my followers? Do my followers acknowledge a
293 relationship with me?

294 It is interesting to note that rewriting the first sentence of the previous paragraph
295 to read, "relationships must be acknowledged by other actors" leads to a
296 discussion of Vendor Relationship Management scenarios and techniques. It also
297 leads to questions of personal sovereignty and data ecosystems.

298 **2.8 Revocable**

299 **Relationships must be revocable.** Identity and access management
300 professionals understand revocation in terms of credential management.
301 However, the common practices around data generated by relationships are less
302 commonly understood. This concept of revocability is also related to developing
303 legal approaches such as the Right to be Forgotten. This is the combination of

304 asymmetry and the ability or lack of ability for a data subject to remove personally
305 identifiable data.

306 Consider that I mistakenly destroy my phone. It was paired to my rental car. What
307 happens to the data the phone passed the car's entertainment system? Should
308 the next driver be able to see the calls I made?

309 Another example from the Internet of Things: I install a smart thermometer in my
310 home. It learns about my family's preferred temperature and over time has saved
311 us money by more efficiently managing the heating and cooling of the house.
312 When we sell the house should the information be available to the new owner?
313 Would I need to give the new owner my account information to the smart
314 thermometer's web site?

315 Other questions that require further consideration include:

- 316 ● Can either party revoke a relationship?
- 317 ● If I sever a relationship should any party who was part of the relationship
318 still have access and use of what was shared in the course of the
319 relationship?
- 320 ● Does this imply the idea of cascading deletes?
321

322 **2.9 Constraining**

323 **Relationships must be constrainable.** All behaviors and allowable actions
324 associated with a relationship must be able to be constrained based on the desires,
325 preferences, and even business models of the parties involved. In some cases, the
326 constraints applied to a relationship looks like consent. For example, a person may allow
327 her device to report its location with her explicit consent. In other cases, the constraints
328 behave like Digital Rights Management (DRM) rather than consent. For example, a
329 device may only function if the owner still has a valid license. It is important to note that
330 although the Working Group believes that relationships should be constrainable, it does
331 not yet have an answer for the question, "What happens when each party attempts to
332 constrain a relationship in conflicting ways?"

333 **3 CONCLUSION**

334 This report has discussed the initial development of Laws of Relationships. The Laws of
335 Relationships have been generated as a result of industry discussions inspired by the
336 Pillars of Identity Relationship Management. The report has visualized some early
337 problem spaces for consideration with regard to the relationships of people, things, and
338 entities as well as the potential effects of the summation of data generation..

339 This report represents an entry in to high-level strategic, policy, and technology review
340 and research around the implications of relationships and their laws, types and axioms.
341 This report is not conclusive but rather it is an attempt to provide a substrate for further
342 industry development.

343 The report asks for industry to comment and test the Laws of Relationships with regard
344 to the following considerations:

- 345 o Internet of Things
 - 346 ▪ Industrial settings (factories, planes, etc)
 - 347 ▪ Citizen (smart homes, sensors in public)
- 348 o Familial Relationships
 - 349 ▪ Insurance
 - 350 ▪ Healthcare
 - 351 ▪ Finance
- 352 o National Identity Programs
- 353

354 This report asks industry to engage in conversation regarding the evolution of identity,
355 and its intersection with Internet of Things (IoT) along the crucial triad of security,
356 privacy, and usability.

357 Further discussion and research regarding the topics discussed in this report are
358 developing within the Kantara Initiative Identity Relationship Management Work Group.
359 Future items the Work Group is considering investigating include:

- 360 • Guides that describe Identity Relationship Management within the context of
361 different industries and different stakeholders
- 362 • Analysis of types of common relationships such a guardianship, citizenship, and
363 ownership and the implications to the laws
- 364 • Formalization of the laws of relationships, an evaluation tool to determine if a
365 system conforms to the law of relationships
- 366 • Notation system to concisely describe relationships
- 367 • Metadata language for informing participants as to the constraints and allowable
368 actions associated with a relationship

369 Please join the work group to share your value and contribution to the initiative.
