## Notice

2 This document has been prepared by Sponsors of the Liberty Alliance. Permission is hereby granted to use the  
3 document solely for the purpose of implementing the Specification. No rights are granted to prepare derivative works  
4 of this Specification. Entities seeking permission to reproduce portions of this document for other uses must contact  
5 the Liberty Alliance to determine whether an appropriate license for such use is available.

6 Implementation of certain elements of this document may require licenses under third party intellectual property  
7 rights, including without limitation, patent rights. The Sponsors of and any other contributors to the Specification are  
8 not and shall not be held responsible in any manner for identifying or failing to identify any or all such third party  
9 intellectual property rights. **This Specification is provided "AS IS", and no participant in the Liberty Alliance  
10 makes any warranty of any kind, express or implied, including any implied warranties of merchantability,  
11 non-infringement of third party intellectual property rights, and fitness for a particular purpose.** Implementers  
12 of this Specification are advised to review the Liberty Alliance Project's website (<http://www.projectliberty.org/>) for  
13 information concerning any Necessary Claims Disclosure Notices that have been received by the Liberty Alliance  
14 Management Board.

## 38 **1. Introduction**

39 This document is the Liberty Alliance Project glossary of normative technical terms.

40 This document is not an exhaustive compendium of all Liberty technical terminology because the Liberty terminology  
41 is built upon existing terminology. Thus many terms that are commonly used within this context are not listed. They  
42 may be found in the glossaries/documents/specifications referenced in the bibliography. Terms defined here that are  
43 not attributed to other glossaries/documents/specifications are being defined here.

44 This glossary is expected to evolve along with the Liberty Alliance Project specifications.

---

## 45 2. Definitions

### 46 Terms

47 AC

48 See *authentication context*.

49 abstract WSDL

50 An *abstract WSDL* service definition is that portion of a *WSDL* document [[WSDLv1.1](#)] — describing said  
51 service — comprised of the `<wsdl:types>`, `<wsdl:message>`, and `<wsdl:portType>` elements.

52 account

53 A formal business agreement providing for regular dealings and services between a Principal and a service  
54 provider [[Merriam-Webster](#)].

55 account linkage

56 See *identity federation*.

57 AD

58 See *Authentication Domain*.

59 affiliation

60 An affiliation is a set of one or more entities, described by providerID's, who may perform Liberty interactions  
61 as a member of the set. An affiliation is referenced by exactly one affiliationID, and is administered by  
62 exactly one entity identified by their providerID. Members of an affiliation may invoke services either as  
63 a member of the affiliation (using affiliationID), or individually (using their providerID). *Affiliation* and  
64 *affiliation group* are equivalent terms.

65 affiliation group

66 See *affiliation*.

67 Affiliation ID

68 An *Affiliation ID* identifies an *affiliation*. It is schematically represented by the affiliationID attribute of  
69 the `<AffiliationDescriptor>` metadata element [[LibertyMetadata](#)].

70 AP

71 See *Attribute Provider*.

72 AS Consumer

73 See *Authentication Service Consumer*.

74 AS Provider

75 See *Authentication Service Provider*.

76 assertion, SAML assertion

77 An XML-based data structure defined by SAML. Assertions are collections of one or more statements, made  
78 by a SAML authority (also known as an *issuer*), such as an authentication statement or attribute statement. As  
79 used in Liberty, assertions typically concern things such as: an act of authentication performed by a Principal,  
80 attribute information about a Principal, or authorization permissions applying to a Principal with respect to a  
81 specified resource.

82 attribute

83 A distinct, named, characteristic of a *Principal* or other *system entity*.

- 
- 84 attribute class  
85       A predefined set of attributes, such as the constituents of a Principal's name (prefix, first name, middle name,  
86       last name, and suffix).
- 87 attribute container  
88       a module comprised of a collection of attributes grouped together according to expected use patterns.
- 89 Attribute Provider (AP)  
90       An *attribute provider* (AP) provides Identity Personal Profile (ID-PP) information. Sometimes referred to as  
91       an ID-PP provider.
- 92 authenticated identity  
93       An *identity*, representing a *system entity*, which often is a *Principal*, that is asserted to have been the subject  
94       of a successful *authentication*.
- 95 authenticated Principal  
96       A Principal who has had his *identity* authenticated by an *Identity Provider*.
- 97 authenticating authority  
98       Synonymous with *authenticating identity provider* or *authenticating IdP*. An *identity provider* that authenti-  
99       cated a *Principal* (see also *authentication*). In [[LibertyAuthnContext](#)], the authenticating authority is identi-  
100      fied by the first occurring <AuthenticatingAuthority> element instance.
- 101 authenticating entity  
102       A *system entity* that engages in the process of authenticating itself to another *system entity*, the latter typically  
103       being an *Identity Provider* (see also *authentication*). More formally, an *authenticating system entity*.
- 104 authentication (authn)  
105       *Authentication* is the process of confirming a *system entity*'s asserted *identity* with a specified, or understood,  
106       level of confidence [[TrustInCyberspace](#)].
- 107 authentication assertion  
108       A SAML-based *assertion* that, in the Liberty specification suite, contains a <lib:AuthenticationStatement>.  
109       Note that the foregoing element is defined in a Liberty namespace. Also known as *Liberty authentication*  
110       *assertion* and *ID-FF authentication assertion*.
- 111       Liberty authentication assertions are formal XML extensions of SAML assertions [[SAMLCore11](#)].  
112       Semantically, an assertion issuer is stating that the subject of the assertion authenticated with it (the issuer) at  
113       some point in time. Assertions are typically time-limited.
- 114 authentication authority  
115       A *system entity* that produces authentication assertions [[SAMLGloss2](#)]. In the Liberty architecture, it is  
116       typically an *Identity Provider*.
- 117 authentication context (AC)  
118       *Authentication Context* is an extensible XML-based "schematic" description of authentication event charac-  
119       teristics [[LibertyAuthnContext](#)].
- 120 Authentication Domain (AD)  
121       An Authentication Domain (AD) is a formal community of Liberty-enabled entities that interact using a set  
122       of well-known common rules.
- 123 authentication exchange  
124       See *authentication protocol exchange*.

- 
- 125 authentication mechanism  
126        An *authentication mechanism* is a particular, identifiable, process or technique that results in a confirmation  
127        of a *system entity*'s asserted *identity* with a specified, or understood, level of confidence. See also *SASL*  
128        *mechanism*. An authentication mechanism may be employed in the process of generating *security tokens*  
129        attesting to the *authenticated identity* of an *authenticating entity*. The ID-WSF Authentication Protocol  
130        specifies such a process [[LibertyAuthn](#)].
- 131 authentication protocol exchange  
132        *Authentication protocol exchange* is the term used in [[RFC4422](#)] to refer to the sequence of messages  
133        exchanged between the *client* and *server* as specified and governed by the particular *SASL mechanism* being  
134        employed to effect an act of *authentication*.
- 135 authentication quality  
136        The level of assurance that a *service provider* can place in an *authentication assertion* it receives from an  
137        *identity provider*.
- 138 authentication server  
139        The precise, specific *role* played by a *server* in the protocol message exchanges defined in the ID-WSF  
140        Authentication Protocol.
- 141 Authentication Service Consumer (AS Consumer)  
142        A *Web Service Consumer* (WSC) implementing the *client*-side of the ID-WSF Authentication Service  
143        [[LibertyAuthn](#)].
- 144 Authentication Service Provider (AS Provider)  
145        A *Web Service Provider* (WSP) implementing the *server*-side of the ID-WSF Authentication Service [[Lib-](#)  
146        *ertyAuthn*].
- 147 authentication session  
148        The period of time starting after A has authenticated B and until A stops trusting B's identity assertion and  
149        requires reauthentication. Also known simply as a *session*, it is the state between a successful login and a  
150        successful logout by a Principal.
- 151 authorization (authz)  
152        The process of determining, by evaluating applicable access control information, whether a subject is allowed  
153        to have the specified types of access to a particular resource. Usually, authorization is in the context of  
154        authentication. Once a subject is authenticated, it may be authorized to perform different types of access  
155        [[SAMLGloss2](#)].
- 156 bearer token  
157        A *bearer token* is a form of *security token* having the property of connoting some attribute(s) to its holder,  
158        or *bearer*. In [[LibertySecMech](#)], bearer tokens connote *identity* and they consist essentially of *credentials* of  
159        some form, e.g. *SAML assertions* [[wss-saml11](#)].
- 160 bootstrap  
161        See *discovery bootstrap*.
- 162 Circle of Trust (CoT)  
163        A federation of service providers and identity providers that have business relationships based on Liberty  
164        architecture and operational agreements and with whom users can transact business in a secure and apparently  
165        seamless environment. Also known as a *Trust Circle*.
- 166 client  
167        A *role* assumed by a *system entity* who makes a request of another system entity, often termed a *server*  
168        [[RFC2828](#)]. A client is at varying times a *sender* or a *receiver*.

- 
- 169 concrete WSDL  
170       A *concrete WSDL* document (which includes at least the `<wsdl:binding>`, `<wsdl:service>`, and  
171       `<wsdl:port>` elements) that contains the *protocol endpoint* information necessary for a client to communi-  
172       cate with a particular *service instance*.
- 173 CoT  
174       See *circle of trust*.
- 175 credentials  
176       Data that is transferred or presented to establish either a claimed *identity* or the authorizations of a *system*  
177       *entity*.
- 178 defederate, defederate identity  
179       To eliminate linkage between a Principal's accounts at an identity provider and a service provider.
- 180 delegation  
181       Enabling a system entity to operate on behalf of a principal to access an identity service.
- 182 discoverable  
183       A *discoverable* "in principle" service is one having an *service type URI* assigned (this is typically in done in  
184       the specification defining the service). A discoverable "in practice" service is one that is registered in some  
185       discovery service instance.  
186       ID-WSF *services* are by definition discoverable in principle because such services are assigned a *service type*  
187       *URI* facilitating their registration in *Discovery Service* instances. Once so registered, they are discoverable in  
188       practice.
- 189 discovery bootstrap  
190       A SAML (see [[SAMLCore2](#)]) `<Attribute>` element defined such that an *Endpoint Reference* (EPR) for the  
191       discovery service itself—an ID-WSF EPR—can be conveyed via SAML assertions. Upon authentication  
192       or SSO, such a "discovery bootstrap" is conveyed to the authenticating (aka relying) party as a part of  
193       the Principal's security token. The relying party is thus able to query the Principal's discovery service for  
194       references to the Principal's other identity services.
- 195 Discovery Service (DS)  
196       An *ID-WSF service* facilitating the registration, and subsequent discovery of, ID-WSF service instances  
197       [[LibertyDisco](#)], as indexed by *Principal identity*. See also *discoverable*.
- 198 Discovery Service Provider (DS Provider)  
199       A *Web Service Provider* (WSP) implementing the *server-side* of the ID-WSF Discovery Service [[Liberty-](#)  
200       Disco].
- 201 endpoint  
202       A term used in [[WSDLv1.1](#)] — it is the short form of *protocol endpoint* — and which itself means an  
203       identified entity, at the current level of abstraction, to which a protocol message, of the same level of  
204       abstraction, may be sent. For example, at the Internet Protocol (IP) layer, an endpoint is represented by  
205       an IP address, and one may send an IP datagram (AKA a "message") to said endpoint. In contrast, at the  
206       HTTP layer, an endpoint is represented by a URL, in conjunction perhaps with other information included in  
207       the so-called "HTTP header".  
208       See also *ID-WSF Endpoint Reference*
- 209 federate  
210       To link or bind two or more entities together.

- 
- 211 federation  
212 (1) The act of establishing a relationship between two entities.  
213 (2) An association comprising any number of service providers and identity providers.
- 214 final SASL response  
215 The final <SASLResponse> message sent from the *server* to the *client* in an *authentication exchange*  
216 [[LibertyAuthn](#)].
- 217 gWS  
218 See *generic web service*.
- 219 gWSP  
220 See *generic Web Service Provider*.
- 221 generic web service (gWS)  
222 A *generic web service* is defined by sense (1) of the *web service* definition.
- 223 generic Web Service Provider (gWSP)  
224 A *generic Web Service Provider* (gWSP) an entity providing *generic web services*.
- 225 header, header block, header element  
226 See *SOAP header block*.
- 227 ID-\*  
228 A shorthand designator referring to the Liberty ID-WSF, ID-FF, and ID-SIS specification sets. For example,  
229 one might say that the former specification sets are all part of the Liberty ID-\* specification suite.
- 230 ID-\* fault message  
231 An *ID-\* fault message* is a SOAP [[SOAPv1.1](#)] <S:Fault> element containing a <Status> element, with  
232 the attributes and attribute values of both elements configured as specified herein, or as specified in other  
233 specification(s) in the ID-WSF or ID-SIS specification sets.
- 234 ID-\* header block  
235 One of the header blocks defined in this specification, or defined in any of the other Liberty ID-\* specification  
236 suite.
- 237 ID-\* message  
238 Equivalent to *ordinary ID-\* message*.
- 239 ID-FF  
240 The Identity Federation Framework (ID-FF) is the title for a subset of the Liberty specification suite which  
241 defines largely HTTP-based protocols for web single sign-on and identity federation [[LibertyProtSchema](#)].
- 242 ID-FF authentication assertion  
243 See *authentication assertion*.
- 244 ID-PP  
245 The "ID Personal Profile" is an *ID-SIS* -based service which can provide profile information regarding  
246 Principals, typically subject to policy established by said Principals [[LibertyIDPP](#)].
- 247 ID-SIS  
248 Liberty Identity Service Interface specification set.
- 249 ID-SIS service  
250 See *ID-SIS-based service*.

- 
- 251 ID-SIS-based service  
252 *ID-SIS-based services* are *identity services* typically built on *ID-WSF* — i.e. they are essentially *ID-*  
253 *WSF-based services* — and are often also built on the [\[LibertyDST\]](#) specification. [\[LibertyIDEP\]](#) and  
254 [\[LibertyIDPP\]](#) are examples of ID-SIS service specifications.
- 255 ID-WSF  
256 Liberty Identity Web Services Framework specification set.
- 257 ID-WSF Endpoint Reference  
258 An *ID-WSF Endpoint Reference* (ID-WSF EPR) is a reference to a *service instance*. It contains the address,  
259 security context, and other metadata necessary for contacting the identified service instance. The underlying  
260 structure of an ID-WSF EPR is based on *wsa:EndpointReference* [\[WSAv1.0-SOAP\]](#) [\[WSAv1.0\]](#), and  
261 conceptually is similar to the *Resource Offering* from earlier versions of the Discovery Service specification.
- 262 ID-WSF EPR  
263 See *ID-WSF Endpoint Reference*.
- 264 ID-WSF service  
265 See *ID-WSF-based service*.
- 266 ID-WSF-based service  
267 An *ID-WSF-based service* is an *identity service* that is at least *discoverable* in principle, and is based on  
268 [\[LibertySOAPBinding\]](#) and [\[LibertySecMech\]](#).
- 269 identity  
270 The essence of an entity. One's *identity* is often described by one's characteristics, among which may be any  
271 number of identifiers.  
272 A *Principal* may wield one or more identities. See also *Principal identity*.
- 273 Identity federation  
274 Creating associations between a given *system entity*'s identifiers or *accounts*.
- 275 Identity Mapping Service (IMS)  
276 An *ID-WSF-based service* that enables a requester to obtain one or more identity tokens (see *identity token*).  
277 It translates references to a principal into alternative formats or identifier namespaces. This service exposes a  
278 generalization of the Name Identifier Mapping protocol defined in [\[SAMLCore2\]](#) [\[LibertyAuthn\]](#).
- 279 Identity Provider (IdP)  
280 A Liberty-enabled *system entity* that manages *identity* information on behalf of *Principals* and provides  
281 assertions of *Principal authentication* to other *providers*.
- 282 identity service  
283 See *identity web service*.
- 284 identity token  
285 *identity tokens* [\[LibertySecMech20SAML\]](#)[\[LibertySecMech\]](#) are a means for conveying the *identity* of a  
286 *Principal* involved in an ID-WSF interaction, by means of stipulating one of the *Principal*'s identifiers, as  
287 well as (typically) an ID-WSF EPR denoting the *Principal*'s Discovery Service.

- 
- 288 identity web service  
289       A type of web service whose operations are indexed by *identity*. Such services maintain information about, or  
290       on behalf of, *Principals* — as represented by their *identities* — and/or perform actions on behalf of Principals.  
291       They are also sometimes referred to as simply *identity services*.
- 292       In Liberty ID-WSF, such services are both mapped on a per-principal basis and *discoverable* — meaning  
293       that once a Principal authenticates, the authenticating party possesses a reference to the Principal's *Discovery*  
294       *Service instance*, which it may use to discover the Principal's other identity services. See also "discoverable".  
295       See also *Discovery Service*, *discoverable*, *web service (2)*, and [[LibertyDisco](#)].
- 296 initial response  
297       A [[RFC4422](#)] term referring to *authentication exchange* data sent by the *client* in the initial SASL request.  
298       It is used by a subset of SASL mechanisms. See Section 5.1 of [[RFC4422](#)].
- 299 initial SASL request  
300       The initial <SASLRequest> message sent from the *client* to the *server* in an *authentication exchange*  
301       [[LibertyAuthn](#)].
- 302 Interaction Service (IS)  
303       An *ID-WSF service* that allows providers to pose simple questions to Principals in order to, for instance,  
304       clarify that Principal's preferences for data sharing, or to supply some needed attribute.
- 305 IdP  
306       See *Identity Provider*.
- 307 invocation identity  
308       The identity of the *system entity* invoking a *service*.
- 309 LEC  
310       See *Liberty-Enabled Client*.
- 311 LECP  
312       See *Liberty-Enabled Client or Proxy* .
- 313 LEP  
314       See *Liberty-Enabled Proxy*.
- 315 Liberty authentication assertion  
316       See *authentication assertion*.
- 317 Liberty-enabled client (LEC)  
318       An entity that has, or knows how to obtain, knowledge about the identity provider that the Principal wishes  
319       to use with the service provider.
- 320 Liberty-enabled client or proxy (LECP)  
321       A Liberty-enabled client is a client that has, or knows how to obtain, knowledge about the identity provider  
322       that the Principal wishes to use with the service provider. A Liberty-enabled proxy is an HTTP proxy  
323       (typically a WAP gateway) that emulates a Liberty-enabled client.
- 324 Liberty-enabled Provider  
325       An umbrella term referring to any *Provider* offering any *ID-FF-*, *ID-WSF-*, or *ID-SIS-*based services.
- 326 Liberty-Enabled Client and Proxy Profile  
327       This profile specifies interactions between Liberty-enabled clients and/or proxies, service providers, and  
328       identity providers [[LibertyBindProf](#)].

- 
- 329 Liberty-enabled Proxy (LEP)  
330 A Liberty-enabled proxy is a HTTP proxy (typically a WAP gateway) that emulates a Liberty-enabled client.
- 331 Liberty-enabled User Agent or Device (LUAD)  
332 A user agent or device that has specific support for one or more profiles of the Liberty specifications. It should  
333 be noted that although a standard web browser can be used in many Liberty-specified scenarios, it does not  
334 provide specific support for the Liberty protocols, and thus is not a LUAD.
- 335 No particular claims of specific functionality should be implied about a system entity solely based on its  
336 definition as a LUAD. Rather, a LUAD may perform one or more Liberty system entity roles as defined by  
337 the Liberty specifications it implements. For example, a LUAD-LECP is a user agent or device that supports  
338 the Liberty LECP profile, and a LUAD-DS would define a user agent or device offering a Liberty ID-WSF  
339 Discovery Service.
- 340 local session state  
341 In the Liberty context, this term refers to a notion of *session state* "local" to, i.e. maintained by, a *provider*,  
342 with respect to an interaction with another *system entity*, typically a *user agent*. Note that the concrete  
343 techniques used to maintain session state vary; cookies [[RFC2965](#)], so-called "URL re-writing", and so-  
344 called "hidden form fields" are the most viable techniques in the HTTP, aka "web", world.
- 345 login  
346 The act of a Principal proving their *identity* to a *system entity*, which typically establishes a *session*.
- 347 logout  
348 The termination of a *session*.
- 349 LUAD  
350 See *Liberty-enabled User Agent or Device*.
- 351 (LUAD-)WSC  
352 A *Web Service Consumer* (WSC), that may or may not also be a *Liberty-enabled User Agent or Device*.
- 353 mechanism  
354 A process or technique for achieving a result [[Merriam-Webster](#)].
- 355 MEP  
356 see Message Exchange Pattern.
- 357 Message Exchange Pattern  
358 A term, borrowed from [[SOAPv1.2](#)], for the overall notion of various patterns of message exchange between  
359 SOAP nodes. For example, request-reply and one-way are two *MEPs* used in this specification.
- 360 message thread  
361 A *message thread* is a synchronous exchange of messages in a request-response *MEP* between  
362 two *SOAP nodes*. All the messages of a given message thread are "linked" via each message's  
363 <wsa:RelatesTo> header block value being set, by the sender, from the previous successfully received  
364 message's <wsa:MessageID> header block value.
- 365 metadata  
366 Definitional data that provides information about other data or *system entities* managed within an application  
367 or environment. In Liberty, *metadata* is *Provider* information that is necessary for interacting with Providers  
368 [[LibertyMetadata](#)].
- 369 network identity  
370 An abstraction, consisting of a *Principal's* global set of attributes, which is composed from a "union" of the  
371 *Principal's accounts*. See also *identity*.

- 
- 372 Non-Transitive Proxy Capability  
373 the ability to act for another entity based on Trusted Authority Policy. The capability is non-transferable.
- 374 opaque handle  
375 An identifier that has meaning only in the context between a specific *identity provider* and specific *service*  
376 *provider*.
- 377 ordinary ID-\* message  
378 An *ordinary ID-\* message* is a Liberty Identity Web Services Framework (ID-WSF) or Service Interface  
379 Specification (ID-SIS) message as defined in the [[LibertyDST](#)], [[LibertyDisco](#)], and [[LibertyIDPP](#)] specifi-  
380 cations and others. It is "ordinary" as opposed to being a *ID-\* fault message* message.  
381 It has the characteristics of being designed to be conveyed by essentially any transport or transfer protocol,  
382 notably SOAP [[SOAPv1.1](#)]. It is also known among the ID-\* specifications as a *service request*, or an ID-  
383 WSF (service) request, or an ID-SIS (service) request.
- 384 PAOS  
385 A Reversed HTTP binding for SOAP [[SOAPv1.1](#)] The primary difference from the normal HTTP binding for  
386 SOAP is that here a SOAP request is bound to a HTTP response and vice versa. "PAOS" is "SOAP" spelled  
387 backwards (pun intended).
- 388 PDP  
389 See *Policy Decision Point*
- 390 PEP  
391 See *Policy Enforcement Point*
- 392 People Service (PS)  
393 An *ID-WSF service* that allows a Principal to share their social network information with different applica-  
394 tions. The PS allows a Principal to manage, track, and group the relationships with their friends, family, and  
395 colleagues.
- 396 permission  
397 Privileges granted to a *system entity* with respect to operations that may be performed on some resource.
- 398 personally identifiable information (PII)  
399 Any data that identifies or locates a particular person, consisting primarily of name, address, telephone  
400 number, e-mail address, bank accounts, or other unique identifiers such as Social Security numbers.
- 401 PII  
402 See *personally identifiable information*.
- 403 policy  
404 A logically defined, enforceable, and testable set of rules.
- 405 Policy Decision Point  
406 A system entity that evaluates decision requests in light of applicable policy and information describing the  
407 requesting entity or entities and renders an authorization decision.
- 408 Policy Enforcement Point  
409 A system entity that performs access control by making decision requests and enforcing authorization  
410 decisions. If the authorization decision is pushed to the PEP there will be no need for it to create a request.

- 
- 411 Principal
- 412 Succinctly, a *principal* is a *system entity* whose *identity* can be authenticated. In Liberty usage, the
- 413 term *Principal* is often synonymous with "natural person" or "user". A Principal's identity may be
- 414 federated. Examples of Principals include individual users, groups of individuals, organizational entities
- 415 e.g. corporations, or a component of the Liberty architecture.
- 416 Principal identity
- 417 An identity being wielded by a Principal, or that is mapped to a Principal in some fashion.
- 418 privacy
- 419 Proper handling of personal information throughout its life cycle, consistent with the preferences of the
- 420 subject.
- 421 processing context
- 422 A *processing context* is the collection of specific circumstances under which a particular processing step or
- 423 set of steps take place.
- 424 processing context facet
- 425 A *processing context facet* is an identified aspect, inherent or additive, of a *processing context*.
- 426 profile
- 427 *Profile* is used in two distinct senses in Liberty specifications:
- 428 1. Data comprising the broad set of attributes that may be maintained on behalf of a *system entity* (typically a
- 429 *Principal*), over and beyond the entity's various identifiers. At least some of this information (for example,
- 430 addresses, preferences, and card numbers) is typically provided by the Principal.
- 431 2. A *profile* of some specification. For example, the Discovery Service specification [[LibertyDisco](#)] *profiles* Web
- 432 Services Addressing specifications [[WSAv1.0](#)][[WSAv1.0-SOAP](#)], and the Security Mechanisms specifications
- 433 [[LibertySecMech](#)] profile SAML [[SAMLCore2](#)].
- 434 protocol endpoint
- 435 A communication point from which data may be sent or received.
- 436 See also *endpoint*, *ID-WSF Endpoint Reference*.
- 437 provider
- 438 A *provider* is a Liberty-enabled entity that performs one or more of the provider *roles* in the Liberty
- 439 architecture, for example *Service Provider* or *Identity Provider*. Providers are identified in Liberty protocol
- 440 interactions by their *Provider IDs* or optionally their *Affiliation ID* if they are a member of an affiliation(s)
- 441 and are acting in that capacity.
- 442 Provider ID
- 443 A *Provider ID* identifies an entity known as a *provider*. It is schematically represented by the `providerID`
- 444 attribute of the `<EntityDescriptor>` metadata element [[LibertyMetadata](#)].
- 445 proxy
- 446 (1) An entity authorized to act for another [[Merriam-Webster](#)].
- 447 (2) A *system entity* whose authenticated identity, according to the *recipient*, differs from that of the system
- 448 entity making the invocation under consideration.
- 449 pseudonym
- 450 An arbitrary identifier assigned by the identity or service provider to identify a Principal to a given relying
- 451 party so that the name has meaning only in the context of the relationship between the parties.

- 
- 452 recipient  
453       An entity that receives a message and acts as the message's ultimate processor.
- 454 RELs  
455       See *Rights Expression Languages*.
- 456 receiver  
457       A *role* taken by a *system entity* when it receives a message sent by another system entity. See also *SOAP*  
458       *receiver* in [SOAPv1.2].
- 459 relying party  
460       The recipient of a message that relies on a request message and associated assertions to determine whether to  
461       provide a requested service.
- 462 requester  
463       A *system entity* which sends a *service request* to a *provider*.
- 464 resource  
465       *Resource* is one of those terribly overloaded terms in the computer science and distributed systems realms.  
466       As used in various Liberty specifications, it has (at least) two definitions, depending on whether one is using  
467       the term in an identity-based context (1) or not (2):
- 468       1. *Resource* refers to either data related to some *identity* or identities, or a *service* acting on behalf of some identity  
469       or group of identities. An example of an identity-based resource is a *Principal's* calendar service.
- 470       2. A *resource* is whatever might be identified with a URI, although often there is a connotation that one might be  
471       able to obtain information of some sort from said "resource".
- 472 resource offering  
473       The association of a resource and a service instance.  
474       This term is superseded in ID-WSFv2 by *ID-WSF Endpoint Reference (ID-WSF EPR)*
- 475 Rights Expression Language (REL)  
476       A *Rights Expression Language* facilitates the expression of who are the "rights holders" for a resource, who  
477       is authorized to use a resource and their applicable permissions, and any constraints or conditions imposed  
478       on such permissions. They also may express "rights entities" and "rights transactions".
- 479 role  
480       A function or part performed, especially in a particular operation or process [Merriam-Webster].
- 481 SAML (Security Assertion Markup Language)  
482       An XML-based standard defining a means for making *assertions* about events, attributes, and policy  
483       evaluations concerning subjects [SAMLCore11]. In Liberty usage, SAML subjects are typically Principals.
- 484 SAML assertion  
485       See *assertion*.
- 486 SAML Authority  
487       An abstract system entity in the SAML domain model that issues assertions [SAMLGloss2].
- 488 SASL  
489       See *Simple Authentication and Security Layer*.

- 
- 490 SASL mechanism
- 491       A *SASL mechanism* is an *authentication mechanism* that has been profiled for use in the context of *SASL*
- 492       [[RFC4422](#)]. See [[RFC2444](#)] for a particular example of profiling an existing authentication mechanism —
- 493       one-time passwords [[RFC2289](#)] — for use as a *SASL mechanism*. See also [[LibertyAuthn](#)].
- 494 security token
- 495       In Liberty, a *security token* is a collection of security-related information that is used to represent and
- 496       substantiate a claim [[LibertyIDWSFSecurityPrivacyGuidelines](#)] [[LibertySecMech](#)].
- 497       Outside of Liberty, the term "security token" often refers to hardware-based devices, e.g. so-called "token
- 498       cards". One should not confuse the latter and the former definitions. However, it is possible for some given
- 499       *authentication mechanism* to employ token cards in the process of *authentication*.
- 500 sender
- 501       (1) A *role* donned by a *system entity* when it constructs and sends a message to another system entity. See
- 502       also *SOAP sender* in [[SOAPv1.2](#)].
- 503       (1a) an initial *SOAP sender*. A sender is a *proxy* when its identity differs from the *invocation identity*.
- 504 server
- 505       A *role* donned by a *system entity* that provides a service in response to requests from other system entities
- 506       called *clients* [[RFC2828](#)]. Note that in order to provide a service to clients; a server will often be both a
- 507       *sender* and a *receiver*.
- 508 service
- 509       (1) A collection of *endpoints* designed to offer some service or to provide information [[WSDLv1.1](#)].
- 510       (2) Short form of *ID-WSF Service* or *ID-WSF-based Service*.
- 511 service discovery
- 512       The act of looking up a *service(s)* in the *Discovery Service*.
- 513 service instance
- 514       The physical instantiation of a service. A service instance is a web service at a distinct endpoint.
- 515       See also *ID-WSF Endpoint Reference*.
- 516 service instance address
- 517       An address of a service instance, typically expressed in URI syntax [[RFC3622](#)].
- 518 Service Provider (SP)
- 519       (1) A *role* donned by *system entities*. In the Liberty architecture, *Service Providers* interact with other system
- 520       entities primarily via vanilla HTTP.
- 521       (2) From a Principal's perspective, a Service Provider is typically a website providing services and/or goods.
- 522 service request
- 523       A *service request* is another term for an *ordinary ID-\* message* sent by a *client*. Service request is also
- 524       loosely equivalent to a "SOAP-bound (ordinary) ID-\* message".
- 525 Service Type URI
- 526       *ID-WSF-based services* are assigned a *Service Type URI* as a part of each service's definition. The Service
- 527       Type URI is a factor in *service discovery* [[LibertyDisco](#)].
- 528 session
- 529       [[Merriam-Webster](#)] defines *session* (in its sixth sense [sic]) as: "a meeting or period devoted to a particular
- 530       activity" [as in "an Irish drinking session", Ed.]. Thus, a given interaction between some set of *system entities*
- 531       may involve a notion of session, especially if one or more of the system entities maintain *session state*.

- 
- 532 session state
- 533       If an interaction between *system entities* involves one or more of the system entities maintaining information
- 534       pertaining to the interaction itself — such as who the other involved system entity(ies) are, when the
- 535       interaction began, etc. — then there likely is an explicit notion of *session* and thus this information is termed
- 536       *session state* information.
- 537       See also *local session state*.
- 538 Simple Authentication and Security Layer (SASL)
- 539       SASL [RFC4422] is an approach to modularizing protocol design such that the security design components,
- 540       e.g. authentication and security layer mechanisms, are reduced to a uniform abstract interface. This facilitates
- 541       a protocol's use of an open-ended set of security mechanisms, as well as a so-called "late binding" between
- 542       implementations of the protocol and the security mechanisms' implementations. This late binding can
- 543       occur at implementation- and/or deployment-time. The SASL specification also defines how one packages
- 544       authentication and security layer mechanisms to fit into the SASL framework, where they are known as *SASL*
- 545       *mechanisms*, as well as register them with the Internet Assigned Numbers Authority [IANA] for reuse.
- 546 single sign-on (SSO)
- 547       From a *Principal's* perspective, *single sign-on* encompasses the capability to authenticate with some *system*
- 548       *entity* — in the Liberty context, an *Identity Provider* — and have that authentication honored by other system
- 549       entities, termed *Service Providers* in the Liberty context.
- 550       Note that upon authenticating with an Identity Provider, the Identity Provider typically establishes and
- 551       maintains some notion of *local session state* between itself and the Principal's *user agent*. Service Providers
- 552       may also maintain their own distinct local session state with a Principal's user agent.
- 553 Single Sign-On Service (SSO Service, SSOS)
- 554       An *ID-WSF-based service* providing *WSCs* a means of obtaining *ID-FF authentication assertions* [Lib-
- 555       ertyAuthn].
- 556 Single Sign-On Service Consumer (SSO Service Consumer, SSOS Consumer)
- 557       A *Web Service Consumer* (WSC) implementing the *client-side* of the ID-WSF Single Sign-On Service
- 558       [LibertyAuthn].
- 559 Single Sign-On Service Provider (SSO Service Provider, SSOS Provider)
- 560       A *Web Service Provider* (WSP) implementing the *server-side* of the ID-WSF Single Sign-On Service
- 561       [LibertyAuthn].
- 562 SOAP (Simple Object Access Protocol)
- 563       An XML envelope and data encoding technology used to communicate information and requests across the
- 564       Web. It is typically considered the protocol used by Web services. It is actually an envelope encapsulation
- 565       format that can be used with lower level Web protocols such as HTTP and FTP. See [SOAPv1.1] and
- 566       [SOAPv1.2].
- 567 SOAP-bound ID-\* message
- 568       A *SOAP message* conveying ID-WSF and perhaps ID-SIS header blocks and conveying either an *ordinary*
- 569       *ID-\* message* or an *ID-\* fault message*. After being bound to SOAP, the resultant composite messages are
- 570       referred to as an *Ordinary SOAP-bound ID-\* Message* and a *SOAP-bound ID-\* Fault Message*, respectively.
- 571 SOAP header block
- 572       A [SOAPv1.2] term meaning: An [element] used to delimit data that logically constitutes a single computa-
- 573       tional unit within the SOAP header. In [SOAPv1.1] these are known as simply *SOAP headers*, or simply
- 574       *headers*. Liberty specifications borrow the SOAPv1.2 terminology.

- 
- 575 SOAP-bound ID-\* message  
576       A *SOAP message* conveying ID-WSF and perhaps ID-SIS header blocks and conveying either an *ordinary*  
577       *ID-\* message* or an *ID-\* fault message*. After being bound to SOAP, the resultant composite messages are  
578       referred to as an *Ordinary SOAP-bound ID-\* Message* and a *SOAP-bound ID-\* Fault Message*, respectively.
- 579 SOAP node  
580       A [[SOAPv1.2](#)] term describing *system entities* who are parties to SOAP-based message exchanges that are,  
581       for purposes of this specification, also the ultimate destination of the exchanged messages, i.e. *SOAP*  
582       *endpoints*. In [[SOAPv1.1](#)], SOAP nodes are referred to as *SOAP endpoints*, or simply *endpoints*. The  
583       Liberty specifications borrow the SOAPv1.2 terminology.
- 584 SP  
585       See *Service Provider*.
- 586 SSL (Secure Sockets Layer Protocol)  
587       An Internet protocol (originally developed by Netscape Communications, Inc.) that uses connection-oriented  
588       end-to-end encryption to provide data confidentiality service and data integrity service for traffic between a  
589       client (often a Web browser) and a server and that can optionally provide peer entity authentication between  
590       the client and the server. See *Transport Layer Security*. [[RFC2828](#)].
- 591 SSO  
592       See *single sign-on*.
- 593 SSOS, SSO Service  
594       See *Single Sign-On Service*.
- 595 SSOS Provider, SSO Service Provider  
596       See *Single Sign-On Service Provider*.
- 597 system entity  
598       An active element of a computer/network system. For example, an automated process or set of processes, a  
599       subsystem, a person or group of persons that incorporates a distinct set of functionality [[SAMLGloss2](#)].
- 600 TLS (Transport Layer Security Protocol)  
601       An evolution of the SSL protocol. The TLS protocol provides communications privacy over the Internet. The  
602       protocol allows client/server applications to communicate in a way that is designed to prevent eavesdropping,  
603       tampering, or message forgery. See [[RFC4346](#)].
- 604 token  
605       See *security token*.
- 606 trust circle  
607       See *Circle of Trust*.
- 608 Trusted Authority  
609       In Liberty, a Trusted Third Party (TTP) which issues and vouches for assertions, otherwise known as an  
610       *Identity Provider*.
- 611 Trusted Third Party  
612       In general, a security authority or its agent, trusted by other entities with respect to security-related activities.  
613       In the context of Liberty, these other entities are, for example, *Principals* and *Service Providers*, and the  
614       trusted third party is typically the *Identity Provider(s)* involved in the particular interaction of interest.
- 615 TTP  
616       See *Trusted Third Party*

- 
- 617 URI (Uniform Resource Identifier)  
618       A compact string of characters for identifying an abstract or physical resource. [RFC3986] defines the generic  
619       syntax of URIs. URNs and URLs are proper subsets of URIs.
- 620 URL (Uniform Resource Locator)  
621       URLs identify resources via a representation of their primary access mechanism (e.g., their network location)  
622       rather than identifying the resource by name or by some other attributes of that resource [RFC3986]. URLs  
623       are a proper subset of URIs.
- 624 URN (Uniform Resource Name)  
625       Persistent, location-independent, resource names with delegatable sub-namespaces, termed *Uniform Re-*  
626       *source Name (URN) Namespaces* [RFC2141]. Liberty's URN Namespace is defined in [RFC3622]. URNs  
627       are a proper subset of URIs.
- 628 user agent  
629       Software that a "natural person" interacts with directly. A user agent typically implements a user interface.  
630       A typical user agent is a web browser. A more specialized sort of user agent is the *Liberty-enabled User*  
631       *Agent or Device* (LUAD).
- 632 user interface  
633       The controls (such as menus, buttons, prompts, etc.) and mechanisms (such as selection and focus) provided  
634       by, e.g., a user agent.
- 635 web service  
636       (1) Generically, a *service* defined in terms of an XML-based protocol, typically transported over *SOAP*, and/or  
637       a service whose instances, and possibly data objects managed therein, are concisely addressable via *URIs*.  
638       Such a *generic web service* (gWS) may be defined in various standardized and/or proprietary contexts.  
639       Various organizations, formal or ad-hoc, have their own particular definitions for this term. For example, the  
640       W3C's definition (see <http://www.w3.org/TR/ws-gloss/>) is:  
641       There are many things that might be called "Web services" in the world at large. However, for the  
642       purpose of this Working Group and this architecture, and without prejudice toward other definitions,  
643       we will use the following definition:  
644       A Web service is a software system designed to support interoperable machine-to-machine inter-  
645       action over a network. It has an interface described in a machine-processable format (specifically  
646       WSDL). Other systems interact with the Web service in a manner prescribed by its description using  
647       SOAP-messages, typically conveyed using HTTP with an XML serialization in conjunction with  
648       other Web-related standards.  
649       (2) As specifically used in Liberty specifications, usually in terms of WSCs and WSPs, it means a web service  
650       that's defined in terms of the *ID-\** "stack", and thus utilizes [LibertySOAPBinding], [LibertySecMech], and  
651       is "discoverable" [LibertyDisco]. See also *identity web service*.  
652       Note that Liberty Identity Web Services also meets the W3C definition.
- 653 Web Service Consumer  
654       A *role* donned by a *system entity* when it makes a request to a *web service*.
- 655 Web Services Description Language  
656       A means to describe the interface of a Web service. See [WSDLv1.1].
- 657 Web Service Provider  
658       A *role* donned by a *system entity* when it provides a *web service*.

- 
- 659 WML (Wireless Markup Language)  
660 A markup language based on XML and intended for use in specifying content and user interface for  
661 narrowband devices, including cellular phones and pagers.
- 662 WSC  
663 See *Web Service Consumer*.
- 664 WSDL  
665 See *Web Services Description Language*.
- 666 WSP  
667 See *Web Service Provider*.
- 668 X.509 token  
669 A *X.509 token* is a type of *security token* containing an X.509 public key certificate.
- 670 XML (eXtensible Markup Language)  
671 A W3C technology for encoding information and documents for exchange over the Web. See [[XML](#)],  
672 [[XMLCanon](#)], [[XMLDsig](#)], [[xmlenc-core](#)], [[Schema1-2](#)] and [[Schema2-2](#)]
