5 Identity Assurance Framework: Overview

6

7

8 **Version:** .3

9 **Date:** 2009-12-31

10 **Editor:** Britta Glade

11

12 **Contributors:**

13 This document is a draft and not in final release form. The full list of contributors will be
14 added prior to the final release of this document.

15 **Abstract:**

16 The Kantara Initiative Identity Assurance Work Group (IAWG) was formed to foster
17 adoption of identity trust services. The primary deliverable of the IAWG is the Identity
18 Assurance Framework (IAF), which is comprised of many different documents that detail
19 the levels of assurance and the certification program that bring the Framework to the
20 marketplace. The IAF is comprised of a set of documents that includes an Overview
21 publication, the IAF [Glossary](#), a summary [Assurance Levels](#) document, and an [Assurance](#)
22 [Assessment Scheme \(AAS\)](#), which encompasses the associated assessment and
23 certification program, as well as several subordinate documents, among them the [Service](#)
24 [Assessment Criteria \(SAC\)](#), which establishes baseline criteria for general organizational
25 conformity, identity proofing services, credential strength, and credential management
26 services against which all CSPs will be evaluated. The present document provides an
27 overview of the IAF documents and program.

54	1 INTRODUCTION.....	4
55	2 Understanding The Kantara Initiative Identity Assurance Framework	7
56		

57 **1 INTRODUCTION**

58 This document relates to the Kantara Initiative Identity Assurance Framework [IAF]
59 which has been developed within the Kantara Initiative Work Group (IAWG) and
60 corresponding public special interest groups with input from members of the global
61 financial services, government, healthcare, IT, and telecommunications sectors.

62 This document is intended to enable non-IAWG participants to understand and
63 familiarize themselves with the IAF and thus be a starting point for industry professionals
64 who want to learn more and possibly conform to the IAF.

65

66 **1.1 Intended Audience**

67

68 The intended audience for this document encompasses users of electronic identity
69 credentials, entities that rely upon these electronic credentials, credential service
70 providers who issue these electronic credentials, and assessors who review the business
71 processes of credential service providers. This audience typically includes managers and
72 decision makers responsible for developing strategies for managing access to online
73 resources based on trustworthy identification of potential users, as well as providers of
74 trustworthy online identity credentials.

75 Other audiences might include potential subjects of online identity services and IT
76 auditors who may be asked to evaluate online identity service providers.

77 The reader should have a basic understanding of technical and practical issues regarding
78 identity and online identity credentials as discussed in such forums, documents, and
79 specifications as the EAP Trust Framework ([\[EAPTrustFramework\]](#)), the US E-
80 Authentication Federation Credential Assessment Framework ([\[CAF\]](#)), and the
81 [\[CABForum\]](#).

82

83 **1.2 Overview**

84

85 In order to conduct any sort of business in an online world, entities (which include
86 people, organizations, applications, machines, etc.) need to be able to identify themselves
87 remotely and reliably. However, in most cases, it is not sufficient for the typical
88 electronic credential (usually a basic userID/password pair or a digital certificate) to
89 simply make the assertion that “I am who I say I am ... believe me.” A relying party
90 needs to be able to know to some degree that the presented electronic identity credential
91 truly represents the individual referred to in the credential. In the case of self-issued
92 credentials, this is generally difficult. However, most electronic identity credentials are
93 issued by Credential Service Providers (CSPs), often referred to as identity providers
94 (IdPs): your workplace network administrator, your social networking service or online

95 game administrator, a government entity, or a trusted third party. You may have multiple
96 credentials from multiple providers ... most people do.

97 There are four main roles involved in making this online exchange trustworthy:

- 98 1. Entities who are the subjects of identity credentials issued by a CSP, variously
99 referred to as “subjects” or “credential holders”;
- 100 2. CSPs who are providers of identity services and issuers of electronic identity
101 credentials;
- 102 3. Auditors or assessors who review the business processes and operating
103 procedures that CSPs follow; and
- 104 4. Entities that rely upon the credentials issued by CSPs, referred to as “relying
105 parties (RPs).”
106

107 Different CSPs follow different policies, rules, and procedures for issuing electronic
108 identity credentials. In the business world, the more trustworthy the credential, the more
109 stringent are the rules governing identity proofing, credential management, and the kinds
110 of credentials issued. But while different CSPs follow their own rules, more and more
111 end users (i.e., subjects) and relying parties (e.g., online services) wish to trust existing
112 credentials and not issue yet another set of credentials for use to access one service. This
113 is where the concept of identity federation becomes important. Federated identity
114 provides CSPs, subjects, and relying parties with a common set of identity trust
115 conventions that transcend individual identity service providers, users, or networks, so
116 that a relying party will know it can trust a credential issued by CSP-1 at a level of
117 assurance comparable to a common standard, which will also be agreed upon by CSP-2,
118 CSP-3, and CSP-4. In this context, an assurance level describes the degree to which a
119 relying party in an electronic exchange can, after performing certain tests to authenticate
120 (validate) the origin of the exchange, be confident that the identity information being
121 presented by a CSP actually represents the entity referred to in it and that it is the
122 represented entity which is actually engaging in the exchange.

123 Identity federation offers many advantages to organizations, including recognized cost
124 and time savings, ability to assure and monitor privacy and security, auditability to meet
125 increasing global compliance demands, and the ability to minimize use and retention of
126 personally identifiable information (PII). The opportunity, and its potential benefits, have
127 been well-documented by early federated identity deployers and users, who recognized
128 identity federation as a logical approach that unlocks a myriad of electronic business and
129 online interactive opportunities which appeal to the end user’s need for simplicity and
130 high level of service.

131 The [IAF](#) provides a means to enable relying parties to understand the trustworthiness of
132 electronic identity credentials by other parties at commonly agreed levels of assurance.
133 The IAF specifies the verification and proofing checks that CSPs carry out on entities, the
134 way that CSPs run their services, and how the CSPs, themselves, are assessed by

135 accredited assessors to verify they are operating their services in conformance with their
136 proclaimed level(s) of assurance and the stated terms of service.

137

138 2 UNDERSTANDING THE KANTARA INITIATIVE 139 IDENTITY ASSURANCE FRAMEWORK

140 The [\[IAF\]](#) is a standardized approach that defines processes and procedures for CSPs, relying
141 parties, and operators of federated identity networks (Federation Operators) to trust each
142 other's credentials at known levels of assurance. The main components of the IAF are:

- 143 1. Assurance Levels;
- 144 2. Glossary;
- 145 3. Assurance Assessment Scheme (AAS), and;
- 146 4. Service Assessment Criteria.

147

148 2.1 Assurance Level Criteria

149

150 Assurance levels are the levels of trust associated with a credential as measured by the
151 associated technology, processes, and policy and practice statements. The IAF defers to the
152 guidance provided by the U.S. National Institute of Standards and Technology (NIST)
153 Special Publication 800-63 version 1.0.2 [\[NIST800-63\]](#) which outlines four levels of
154 assurance, ranging in confidence level from low to very high. The level of assurance
155 provided is measured by the strength and rigor of the identity verification and proofing
156 process, the credential's strength, and the management processes the CSP applies to it. The
157 IAF then goes on to describe the service assessment criteria at each assurance level.

158 On the relying party side, these same four assurance levels address increasing levels of risk.
159 For each Assurance Level, the IAF defines commensurate risk mitigation measures
160 appropriate for the level of trust that may be assumed in the identity credentials. These four
161 levels have been adopted by the U.K. government, the Government of Canada, and the U.S.
162 Federal Government for categorizing required electronic identity trust levels for providing
163 electronic government services.

164 A summary of the IAF's approach to assurance levels is provided in the [Assurance Level](#)
165 document.

166

167 2.2 Glossary

168 The [Glossary](#) document of the IAF provides a brief summary of more than 80 commonly
169 used terms that are used across IAF documents. It presents readers with a baseline
170 understanding of how terms are used to enable better understanding of the programs and
171 processes being discussed. As terms and usage can vary from industry to industry, it is
172 recommended reading for anyone wanting a strong baseline understanding of the Identity
173 Assurance Framework.

174

175 **2.3 Assurance Assessment Scheme**

176
177 The [Assurance Assessment Scheme](#) (AAS) portion of the IAF defines the phased approach
178 used to establish criteria for certification and accreditation, initially focusing on CSPs and the
179 accreditation of the assessors who will certify and evaluate them. The goal of this phased
180 approach is to provide, initially, federations and Federation Operators with the means to
181 certify their members for the benefit of inter-federation and to streamline the certification
182 process for the industry. It is anticipated that follow-on phases will target the development of
183 criteria for certification of federations, themselves, as well as best practices guidelines for
184 relying parties.

185 The AAS establishes the requirements that assessors must have in order to perform
186 assessments or audits, thus earning the associated Kantara Initiative Mark. It also defines the
187 rules and requirements they will use when performing the actual assessments on CSPs vying
188 to earn the associated Kantara Initiative Mark(s) for Kantara Initiative accreditation.

189

190 **2.4 Service Assessment Criteria**

191
192 The [Service Assessment Criteria](#) (SAC) document establishes baseline criteria for
193 organizational conformity, identity-proofing services, credential strength, and credential
194 management services against which all CSPs will be evaluated. The IAF also establishes a
195 protocol for publishing updates, as needed, to account for technological advances and
196 preferred practice and policy updates.

197 These criteria set out the requirements that identity services and their CSPs must meet at each
198 assurance level within the IAF in order to receive Kantara Initiative accreditation.

199 CSPs can determine the assurance levels at which their services might qualify by
200 evaluating their overall business processes and technical mechanisms against the Service
201 Assessment Criteria. The Service Assessment Criteria within each assurance level are the
202 basis for assessing and approving electronic trust services.
